# Today's lecture

- Neural networks: huge empirical success but poor theoretical understanding
- Key idea: representation learning
- Optimization: backpropagation + SGD

Many problems are non-linear

- Many problems are non-linear
- We can express certain non-linear models in a linear form:

$$f(x) = w^T \phi(x). \tag{1}$$

- Many problems are non-linear
- We can express certain non-linear models in a linear form:

$$f(x) = w^T \phi(x). \tag{1}$$

• Note that this model is not linear in the inputs x — we represent the inputs differently, and the new representation is amenable to linear modeling

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 3 / 57

- Many problems are non-linear
- We can express certain non-linear models in a linear form:

$$f(x) = w^{T} \phi(x). \tag{1}$$

- Note that this model is not linear in the inputs x we represent the inputs differently, and the new representation is amenable to linear modeling
- ullet For example, we can use a feature map that defines a kernel, e.g., polynomials in x

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 3/57

Example: predicting how popular a restaurant is
 Raw features #dishes, price, wine option, zip code, #seats, size

- Example: predicting how popular a restaurant is
   Raw features #dishes, price, wine option, zip code, #seats, size
- Decomposing the problem into subproblems:
  - $h_1([\#dishes, price, wine option]) = food quality$
  - h<sub>2</sub>([zip code]) = walkable
  - $h_3([\#seats, size]) = noisy$

- Example: predicting how popular a restaurant is
   Raw features #dishes, price, wine option, zip code, #seats, size
- Decomposing the problem into subproblems:
  - $h_1([\#dishes, price, wine option]) = food quality$
  - $h_2([zip code]) = walkable$
  - h<sub>3</sub>([#seats, size]) = noisy
- Each intermediate models solves one of the subproblems

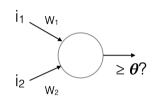

- Example: predicting how popular a restaurant is
   Raw features #dishes, price, wine option, zip code, #seats, size
- Decomposing the problem into subproblems:
  - $h_1([\#dishes, price, wine option]) = food quality$
  - $h_2([zip code]) = walkable$
  - h<sub>3</sub>([#seats, size]) = noisy
- Each intermediate models solves one of the subproblems
- A final *linear* predictor uses the **intermediate features** computed by the  $h_i$ 's:

 $w_1 \cdot \text{food quality} + w_2 \cdot \text{walkable} + w_3 \cdot \text{noisy}$ 

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 4/57

## Perceptrons as logical gates

 Suppose that our input features indicate light at a two points in space (0 = no light; 1 = light)

 How can we build a perceptron that detects when there is light in both locations?

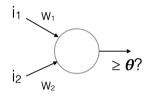

$$w_1 = 1, w_2 = 1, \theta = 2$$

İ <sub>1</sub>	i <sub>2</sub>	W1İ1+W2İ2
0	0	0
0	1	1
1	0	1
1	1	2

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 5/57

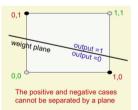

# Limitations of a perceptrons as logical gates

 Can we build a perceptron that fires when the two pixels have the same value (i<sub>1</sub> = i<sub>2</sub>)?

$$\begin{aligned} w_1 + w_2 &\geq \theta, & 0 \geq \theta \\ w_1 &< \theta, & w_2 &< \theta \end{aligned}$$

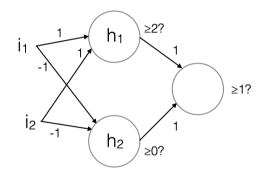

If  $\theta$  is negative, the sum of two numbers that are both less than  $\theta$  cannot be greater than  $\theta$ 

6 / 57

# Multilayer perceptron

• Fire when the two pixels have the same value  $(i_1 = i_2)$ 

			Hidden layer input		Hidden layer output		
	İ1	i <sub>2</sub>	h <sub>1</sub>	h <sub>2</sub>	h <sub>1</sub>	h <sub>2</sub>	0
<b>X</b> 1	0	0	0	0	0	1	1
01	0	1	1	-1	0	0	0
<b>O</b> 2	1	0	1	-1	0	0	0
<b>X</b> 2	1	1	2	-2	1	0	1

(for  $x_1$  and  $x_2$  the correct output is 1; for  $o_1$  and  $o_2$  the correct output is 0)

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 7/57

# Multilayer perceptron

 Recode the input: the hidden layer representations are now linearly separable

			Hidden layer input		Hidden layer output		
	İ1	i <sub>2</sub>	h <sub>1</sub>	h <sub>2</sub>	h <sub>1</sub>	h <sub>2</sub>	0
<b>X</b> 1	0	0	0	0	0	1	1
O <sub>1</sub>	0	1	1	-1	0	0	0
<b>O</b> 2	1	0	1	-1	0	0	0
<b>X</b> 2	1	1	2	-2	1	0	1

Not linearly separable

Linearly separable

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 8 / 57

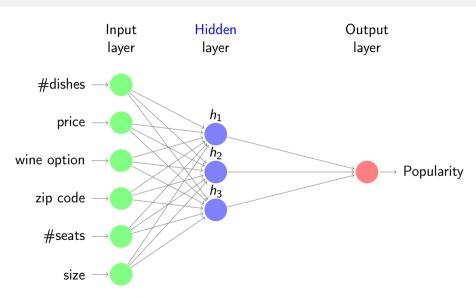

# Decomposing the problem into predefined subproblems

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023

9 / 57

### Learned intermediate features

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 10 / 57

#### Neural networks

Key idea: learn the intermediate features.

Feature engineering Manually specify  $\phi(x)$  based on domain knowledge and learn the weights:

$$f(x) = \mathbf{w}^T \phi(x). \tag{2}$$

### Neural networks

Key idea: learn the intermediate features.

Feature engineering Manually specify  $\phi(x)$  based on domain knowledge and learn the weights:

$$f(x) = \mathbf{w}^T \phi(x). \tag{2}$$

Feature learning Learn both the features (K hidden units) and the weights:

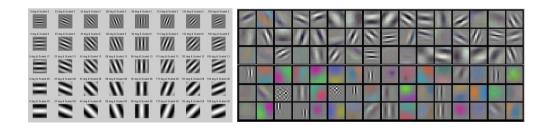

$$h(x) = [h_1(x), \dots, h_K(x)],$$
 (3)

$$f(x) = \mathbf{w}^T h(x) \tag{4}$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 11/57

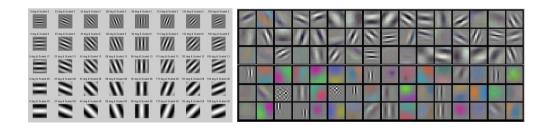

### Feature learning example

• A filter convolves over the image and looks for the highest pattern match.

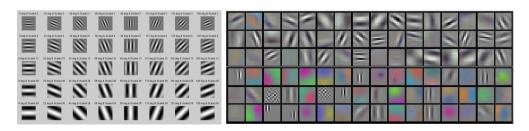

# Feature learning example

- A filter convolves over the image and looks for the highest pattern match.
- Traditionally, people use Gabor filters or other image feature extractors, e.g. SIFT, SURF, etc, and an SVM on top for image classification.

## Feature learning example

- A filter convolves over the image and looks for the highest pattern match.
- Traditionally, people use Gabor filters or other image feature extractors, e.g. SIFT, SURF, etc, and an SVM on top for image classification.
- Neural networks take in images and can learn the filters that are the most useful for solving the tasks. Likely more efficient than hand engineered features.

### Inspiration: The brain

• Our brain has about 100 billion ( $10^{11}$ ) neurons, each of which communicates (is connected) to  $\sim 10^4$  other neurons, with non-linear computations.

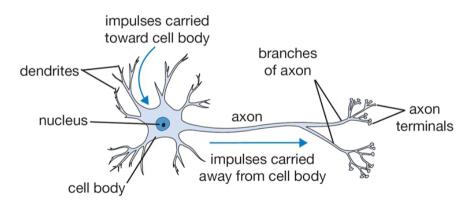

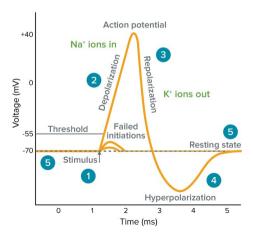

Figure: The basic computational unit of the brain: Neuron

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 13 / 57

## Inspiration: The brain

 Neurons receive input signals and accumulate voltage. After some threshold they will fire spiking responses.

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023

14 / 57

• We can model a simpler computation by using "activation function".

- We can model a simpler computation by using "activation function".
- It applies a non-linearity on the inputs and "fires" after some threshold.

- We can model a simpler computation by using "activation function".
- It applies a non-linearity on the inputs and "fires" after some threshold.

$$h_i(x) = \sigma(v_i^T x). \tag{5}$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 15 / 57

- We can model a simpler computation by using "activation function".
- It applies a non-linearity on the inputs and "fires" after some threshold.

$$h_i(x) = \sigma(v_i^T x). \tag{5}$$

• Some possible activation functions:

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 15 / 57

- We can model a simpler computation by using "activation function".
- It applies a non-linearity on the inputs and "fires" after some threshold.

$$h_i(x) = \sigma(v_i^T x). \tag{5}$$

- Some possible activation functions:
  - sign function (as in classic perceptron)? Non-differentiable.

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 15/57

- We can model a simpler computation by using "activation function".
- It applies a non-linearity on the inputs and "fires" after some threshold.

$$h_i(x) = \sigma(v_i^T x). \tag{5}$$

- Some possible activation functions:
  - sign function (as in classic perceptron)? Non-differentiable.
  - Differentiable approximations: sigmoid functions.
    - E.g., logistic function, hyperbolic tangent function.

CSCI-GA 2565 Nov 21, 2023 15 / 57 Mengve Ren (NYU)

- We can model a simpler computation by using "activation function".
- It applies a non-linearity on the inputs and "fires" after some threshold.

$$h_i(x) = \sigma(v_i^T x). \tag{5}$$

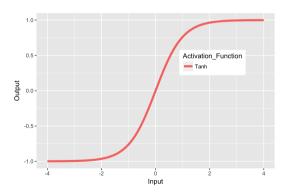

- Some possible activation functions:
  - sign function (as in classic perceptron)? Non-differentiable.
  - Differentiable approximations: sigmoid functions.
    - E.g., logistic function, hyperbolic tangent function.
- Two-layer neural network (one hidden layer and one output layer) with K hidden units:

$$f(x) = \sum_{k=1}^{K} w_k h_k(x) = \sum_{k=1}^{K} w_k \sigma(v_k^T x)$$
 (6)

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 15/57

• The hyperbolic tangent is a common activation function:

$$\sigma(x) = \tanh(x).$$

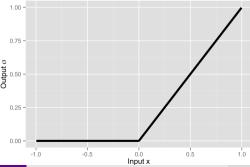

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 16/57

• More recently, the rectified linear (ReLU) function has been very popular:

$$\sigma(x) = \max(0, x).$$

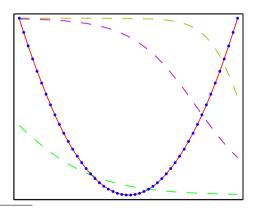

- Faster to calculate this function and its derivatives
- Often more effective in practice

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 17/57

# Approximation Ability: $f(x) = x^2$

- 3 hidden units; tanh activation functions
- Blue dots are training points; dashed lines are hidden unit outputs; final output in red.

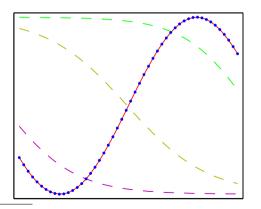

From Bishop's Pattern Recognition and Machine Learning, Fig 5.3

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 18/57

# Approximation Ability: $f(x) = \sin(x)$

- 3 hidden units; logistic activation function
- Blue dots are training points; dashed lines are hidden unit outputs; final output in red.

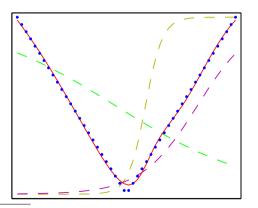

From Bishop's Pattern Recognition and Machine Learning, Fig 5.3

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 19/57

# Approximation Ability: f(x) = |x|

# Universal approximation theorem

### Theorem (Universal approximation theorem)

A neural network with one possibly huge hidden layer  $\hat{F}(x)$  can approximate any continuous function F(x) on a closed and bounded subset of  $\mathbb{R}^d$  under mild assumptions on the activation function, i.e.  $\forall \epsilon > 0$ , there exists an integer N s.t.

$$\hat{F}(x) = \sum_{i=1}^{N} w_i \sigma(v_i^T x + b_i)$$
(7

satisfies  $|\hat{F}(x) - F(x)| < \epsilon$ .

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 21/57

### Universal approximation theorem

ullet For the theorem to work, the number of hidden units needs to be exponential in d

#### Universal approximation theorem

- For the theorem to work, the number of hidden units needs to be exponential in d
- The theorem doesn't tell us how to find the parameters of this network

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 22 / 57

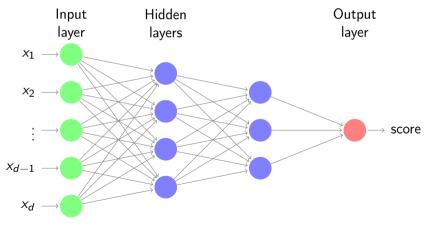

#### Universal approximation theorem

- For the theorem to work, the number of hidden units needs to be exponential in d
- The theorem doesn't tell us how to find the parameters of this network
- It doesn't explain why practical neural networks work, or tell us how to build them

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 22 / 57

#### Deep neural networks

- Wider: more hidden units (as in the approximation theorem).
- Deeper: more hidden layers.

Nov 21, 2023

23 / 57

Mengye Ren (NYU) CSCI-GA 2565

- Input space:  $\mathfrak{X} = \mathbb{R}^d$  Output space  $\mathfrak{Y} = \mathbb{R}^k$  (for k-class classification).
- Let  $\sigma: R \to R$  be an activation function (e.g. tanh or ReLU).
- Let's consider an MLP of L hidden layers, each having m hidden units.

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 24/57

- Input space:  $\mathfrak{X} = \mathbb{R}^d$  Output space  $\mathfrak{Y} = \mathbb{R}^k$  (for *k*-class classification).
- Let  $\sigma: R \to R$  be an activation function (e.g. tanh or ReLU).
- Let's consider an MLP of L hidden layers, each having m hidden units.
- First hidden layer is given by

$$h^{(1)}(x) = \sigma\left(W^{(1)}x + b^{(1)}\right),$$

for parameters  $W^{(1)} \in \mathbb{R}^{m \times d}$  and  $b \in \mathbb{R}^m$ , and where  $\sigma(\cdot)$  is applied to each entry of its argument.

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 24/57

• Each subsequent hidden layer takes the output  $o \in \mathbb{R}^m$  of previous layer and produces

$$h^{(j)}(o^{(j-1)}) = \sigma(W^{(j)}o^{(j-1)} + b^{(j)}), \text{ for } j = 2, ..., L$$

where  $W^{(j)} \in \mathbb{R}^{m \times m}$ ,  $b^{(j)} \in \mathbb{R}^m$ .

• Each subsequent hidden layer takes the output  $o \in \mathbb{R}^m$  of previous layer and produces

$$h^{(j)}(o^{(j-1)}) = \sigma(W^{(j)}o^{(j-1)} + b^{(j)}), \text{ for } j = 2, ..., L$$

where  $W^{(j)} \in \mathbb{R}^{m \times m}$ ,  $b^{(j)} \in \mathbb{R}^m$ .

• Last layer is an *affine* mapping (no activation function):

$$a(o^{(L)}) = W^{(L+1)}o^{(L)} + b^{(L+1)},$$

where  $W^{(L+1)} \in \mathbb{R}^{k \times m}$  and  $b^{(L+1)} \in \mathbb{R}^k$ .

• Each subsequent hidden layer takes the output  $o \in \mathbb{R}^m$  of previous layer and produces

$$h^{(j)}(o^{(j-1)}) = \sigma(W^{(j)}o^{(j-1)} + b^{(j)}), \text{ for } j = 2, ..., L$$

where  $W^{(j)} \in \mathbb{R}^{m \times m}$ ,  $b^{(j)} \in \mathbb{R}^m$ .

• Last layer is an *affine* mapping (no activation function):

$$a(o^{(L)}) = W^{(L+1)}o^{(L)} + b^{(L+1)},$$

where  $W^{(L+1)} \in \mathbb{R}^{k \times m}$  and  $b^{(L+1)} \in \mathbb{R}^k$ .

• The full neural network function is given by the *composition* of layers:

$$f(x) = \left(a \circ h^{(L)} \circ \dots \circ h^{(1)}\right)(x) \tag{8}$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 25/57

• Each subsequent hidden layer takes the output  $o \in R^m$  of previous layer and produces

$$h^{(j)}(o^{(j-1)}) = \sigma(W^{(j)}o^{(j-1)} + b^{(j)}), \text{ for } j = 2,...,L$$

where  $W^{(j)} \in \mathbb{R}^{m \times m}$ ,  $b^{(j)} \in \mathbb{R}^m$ .

• Last layer is an *affine* mapping (no activation function):

$$a(o^{(L)}) = W^{(L+1)}o^{(L)} + b^{(L+1)},$$

where  $W^{(L+1)} \in \mathbb{R}^{k \times m}$  and  $b^{(L+1)} \in \mathbb{R}^k$ .

• The full neural network function is given by the *composition* of layers:

$$f(x) = \left(a \circ h^{(L)} \circ \dots \circ h^{(1)}\right)(x) \tag{8}$$

• Typically, the last layer gives us a score. How do we perform classification?

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 25/57

## What did we do in multinomial logistic regression?

• From each x, we compute a linear score function for each class:

$$x \mapsto (\langle w_1, x \rangle, \dots, \langle w_k, \rangle) \in \mathbb{R}^k$$

• We need to map this  $R^k$  vector into a probability vector  $\theta$ .

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 26 / 57

# What did we do in multinomial logistic regression?

• From each x, we compute a linear score function for each class:

$$x \mapsto (\langle w_1, x \rangle, \dots, \langle w_k, \rangle) \in \mathbb{R}^k$$

- We need to map this  $R^k$  vector into a probability vector  $\theta$ .
- The softmax function maps scores  $s = (s_1, ..., s_k) \in \mathbb{R}^k$  to a categorical distribution:

$$(s_1, \dots, s_k) \mapsto \theta = \mathbf{Softmax}(s_1, \dots, s_k) = \left(\frac{\exp(s_1)}{\sum_{i=1}^k \exp(s_i)}, \dots, \frac{\exp(s_k)}{\sum_{i=1}^k \exp(s_i)}\right)$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 26 / 57

#### Nonlinear Generalization of Multinomial Logistic Regression

• From each x, we compute a non-linear score function for each class:

$$x \mapsto (f_1(x), \dots, f_k(x)) \in \mathbb{R}^k$$

where  $f_i$ 's are the outputs of the last hidden layer of a neural network.

• Learning: Maximize the log-likelihood of training data

$$\underset{f_1,\ldots,f_k}{\operatorname{arg\,max}} \sum_{i=1}^n \log \left[ \operatorname{Softmax} \left( f_1(x),\ldots,f_k(x) \right)_{y_i} \right].$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 27/57

#### Interim discussion

- With the right representations, we can turn nonlinear problems into linear ones
- The goal of representation learning is to automatically discover useful features from raw data

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 28 / 57

#### Interim discussion

- With the right representations, we can turn nonlinear problems into linear ones
- The goal of representation learning is to automatically discover useful features from raw data
- Building blocks:

```
Input layer no learnable parameters

Hidden layer(s) affine + nonlinear activation function

Output layer affine (+ softmax)
```

- With the right representations, we can turn nonlinear problems into linear ones
- The goal of representation learning is to automatically discover useful features from raw data
- Building blocks:

```
Input layer no learnable parameters

Hidden layer(s) affine + nonlinear activation function

Output layer affine (+ softmax)
```

- A single, potentially huge hidden layer is sufficient to approximate any function
- In practice, it is often helpful to have multiple hidden layers

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 28 / 57

#### Fitting the parameters of an MLP

• Input space: X = R

• Output space: y = R

• Hypothesis space: MLPs with a single 3-node hidden layer:

$$f(x) = w_0 + w_1 h_1(x) + w_2 h_2(x) + w_3 h_3(x),$$

where

$$h_i(x) = \sigma(v_i x + b_i) \text{ for } i = 1, 2, 3,$$

for some fixed activation function  $\sigma: R \to R$ .

• What are the parameters we need to fit?

#### Fitting the parameters of an MLP

• Input space: X = R

• Output space: y = R

• Hypothesis space: MLPs with a single 3-node hidden layer:

$$f(x) = w_0 + w_1 h_1(x) + w_2 h_2(x) + w_3 h_3(x),$$

where

$$h_i(x) = \sigma(v_i x + b_i)$$
 for  $i = 1, 2, 3$ ,

for some fixed activation function  $\sigma: R \to R$ .

• What are the parameters we need to fit?

$$b_1, b_2, b_3, v_1, v_2, v_3, w_0, w_1, w_2, w_3 \in R$$

## Finding the best hypothesis

• As usual, we choose our prediction function using empirical risk minimization.

## Finding the best hypothesis

- As usual, we choose our prediction function using empirical risk minimization.
- Our hypothesis space is parameterized by

$$\theta = (b_1, b_2, b_3, v_1, v_2, v_3, w_0, w_1, w_2, w_3) \in \Theta = R^{10}$$

## Finding the best hypothesis

- As usual, we choose our prediction function using empirical risk minimization.
- Our hypothesis space is parameterized by

$$\theta = (b_1, b_2, b_3, v_1, v_2, v_3, w_0, w_1, w_2, w_3) \in \Theta = R^{10}$$

• For a training set  $(x_1, y_1), \ldots, (x_n, y_n)$ , our goal is to find

$$\hat{\theta} = \underset{\theta \in \mathbb{R}^{10}}{\operatorname{arg\,min}} \frac{1}{n} \sum_{i=1}^{n} \left( f(x_i; \theta) - y_i \right)^2.$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 30 / 57

## How do we learn these parameters?

• For a training set  $(x_1, y_1), \ldots, (x_n, y_n)$ , our goal is to find

$$\hat{\theta} = \underset{\theta \in \mathbb{R}^{10}}{\operatorname{arg\,min}} \frac{1}{n} \sum_{i=1}^{n} \left( f(x_i; \theta) - y_i \right)^2.$$

- We can use gradient descent
- Is f differentiable w.r.t.  $\theta$ ?  $f(x) = w_0 + \sum_{i=1}^3 w_i \tanh(v_i x + b_i)$ .

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 31/57

## How do we learn these parameters?

• For a training set  $(x_1, y_1), \ldots, (x_n, y_n)$ , our goal is to find

$$\hat{\theta} = \underset{\theta \in \mathbb{R}^{10}}{\operatorname{arg\,min}} \frac{1}{n} \sum_{i=1}^{n} \left( f(x_i; \theta) - y_i \right)^2.$$

- We can use gradient descent
- Is f differentiable w.r.t.  $\theta$ ?  $f(x) = w_0 + \sum_{i=1}^3 w_i \tanh(v_i x + b_i)$ .
- Is the loss convex in  $\theta$ ?

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 31/57

## How do we learn these parameters?

• For a training set  $(x_1, y_1), \ldots, (x_n, y_n)$ , our goal is to find

$$\hat{\theta} = \underset{\theta \in \mathbb{R}^{10}}{\operatorname{arg\,min}} \frac{1}{n} \sum_{i=1}^{n} \left( f(x_i; \theta) - y_i \right)^2.$$

- We can use gradient descent
- Is f differentiable w.r.t.  $\theta$ ?  $f(x) = w_0 + \sum_{i=1}^3 w_i \tanh(v_i x + b_i)$ .
- Is the loss convex in  $\theta$ ?
  - tanh is not convex
  - Regardless of nonlinearity, the composition of convex functions is not necessarily convex
- We might converge to a local minimum.

## Gradient descent for (large) neural networks

- Mathematically, it's just *partial derivatives*, which you can compute by hand using the *chain rule* 
  - In practice, this could be time-consuming and error-prone

## Gradient descent for (large) neural networks

- Mathematically, it's just *partial derivatives*, which you can compute by hand using the *chain rule* 
  - In practice, this could be time-consuming and error-prone
- Back-propagation computes gradients for neural networks (and other models) in a systematic and efficient way

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 32 / 57

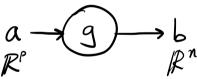

## Gradient descent for (large) neural networks

- Mathematically, it's just *partial derivatives*, which you can compute by hand using the *chain rule* 
  - In practice, this could be time-consuming and error-prone
- Back-propagation computes gradients for neural networks (and other models) in a systematic and efficient way
- We can visualize the process using *computation graphs*, which expose the structure of the computation (modularity and dependency)

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 32/57

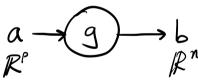

#### Functions as nodes in a graph

- We represent each component of the network as a *node* that takes in a set of *inputs* and produces a set of *outputs*.
- Example:  $g: \mathbb{R}^p \to \mathbb{R}^n$ .
  - Typical computation graph:

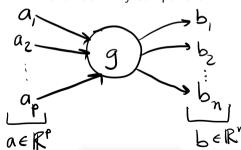

#### Functions as nodes in a graph

- We represent each component of the network as a *node* that takes in a set of *inputs* and produces a set of *outputs*.
- Example:  $g: \mathbb{R}^p \to \mathbb{R}^n$ .
  - Typical computation graph:

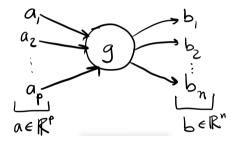

• Broken down by component:

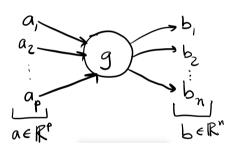

33 / 57

• Define the affine function g(x) = Mx + c, for  $M \in \mathbb{R}^{n \times p}$  and  $c \in \mathbb{R}$ .

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 34/57

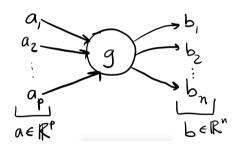

• Define the affine function g(x) = Mx + c, for  $M \in \mathbb{R}^{n \times p}$  and  $c \in \mathbb{R}$ .

• Let b = g(a) = Ma + c. What is  $b_i$ ?

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 34/57

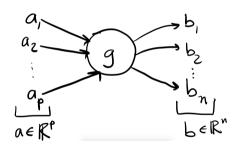

• Define the affine function g(x) = Mx + c, for  $M \in \mathbb{R}^{n \times p}$  and  $c \in \mathbb{R}$ .

- Let b = g(a) = Ma + c. What is  $b_i$ ?
- $b_i$  depends on the *i*th row of M:

$$b_i = \sum_{k=1}^p M_{ik} a_k + c_i.$$

• Define the affine function g(x) = Mx + c, for  $M \in \mathbb{R}^{n \times p}$  and  $c \in \mathbb{R}$ .

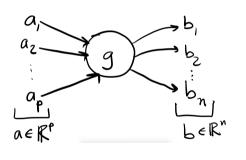

- Let b = g(a) = Ma + c. What is  $b_i$ ?
- $b_i$  depends on the *i*th row of M:

$$b_i = \sum_{k=1}^p M_{ik} a_k + c_i.$$

• If  $a_j \leftarrow a_j + \delta$ , what is  $b_i$ ?

$$b_i \leftarrow b_i + M_{ij}\delta$$
.

The partial derivative/gradient measures *sensitivity*: If we perturb an input a little bit, how much does the output change?

#### Partial derivatives in general

• Consider a function  $g: \mathbb{R}^p \to \mathbb{R}^n$ .

- Partial derivative  $\frac{\partial b_i}{\partial a_j}$  is the rate of change of  $b_i$  as we change  $a_j$
- If we change  $a_j$  slightly to

$$a_j + \delta$$
,

• Then (for small  $\delta$ ),  $b_i$  changes to approximately

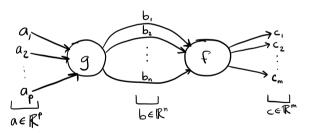

$$b_i + \frac{\partial b_i}{\partial a_j} \delta$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 35/57

## Composing multiple functions

- We have  $g: \mathbb{R}^p \to \mathbb{R}^n$  and  $f: \mathbb{R}^n \to \mathbb{R}^m$
- b = g(a), c = f(b).

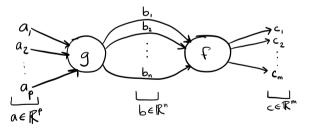

• How does a small change in  $a_j$  affect  $c_i$ ?

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 36 / 57

# Composing multiple functions

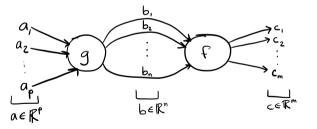

- We have  $g: \mathbb{R}^p \to \mathbb{R}^n$  and  $f: \mathbb{R}^n \to \mathbb{R}^m$
- b = g(a), c = f(b).

- How does a small change in  $a_j$  affect  $c_i$ ?
- Visualizing the **chain rule**:
  - We sum changes induced on all paths from  $a_j$  to  $c_i$ .
  - The change contributed by each path is the product of changes on each edge along the path.

# Composing multiple functions

- We have  $g: \mathbb{R}^p \to \mathbb{R}^n$  and  $f: \mathbb{R}^n \to \mathbb{R}^m$
- b = g(a), c = f(b).

- How does a small change in  $a_i$  affect  $c_i$ ?
- Visualizing the **chain rule**:
  - We sum changes induced on all paths from  $a_j$  to  $c_i$ .
  - The change contributed by each path is the product of changes on each edge along the path.

$$\frac{\partial c_i}{\partial a_j} = \sum_{k=1}^n \frac{\partial c_i}{\partial b_k} \frac{\partial b_k}{\partial a_j}.$$

#### Example: Linear least squares

- Hypothesis space  $\{f(x) = w^T x + b \mid w \in \mathbb{R}^d, b \in \mathbb{R}\}.$
- Data set  $(x_1, y_1), \ldots, (x_n, y_n) \in \mathbb{R}^d \times \mathbb{R}$ .
- Define

$$\ell_i(w,b) = \left[\left(w^T x_i + b\right) - y_i\right]^2.$$

#### Example: Linear least squares

- Hypothesis space  $\{f(x) = w^T x + b \mid w \in \mathbb{R}^d, b \in \mathbb{R}\}.$
- Data set  $(x_1, y_1), \ldots, (x_n, y_n) \in \mathbb{R}^d \times \mathbb{R}$ .
- Define

$$\ell_i(w,b) = \left[\left(w^T x_i + b\right) - y_i\right]^2.$$

• In SGD, in each round we choose a random training instance  $i \in 1, ..., n$  and take a gradient step

$$w_j \leftarrow w_j - \eta \frac{\partial \ell_i(w, b)}{\partial w_j}, \text{ for } j = 1, \dots, d$$
  
 $b \leftarrow b - \eta \frac{\partial \ell_i(w, b)}{\partial b},$ 

for some step size  $\eta > 0$ .

• How do we calculate these partial derivatives on a computation graph?

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 37/57

• For a training point (x, y), the loss is

$$\ell(w,b) = \left[ \left( w^T x + b \right) - y \right]^2.$$

• For a training point (x, y), the loss is

$$\ell(w,b) = \left[ \left( w^T x + b \right) - y \right]^2.$$

• Let's break this down into intermediate computations:

(prediction) 
$$\hat{y} = \sum_{j=1}^d w_j x_j + b$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023

38 / 57

• For a training point (x, y), the loss is

$$\ell(w,b) = \left[ \left( w^T x + b \right) - y \right]^2.$$

• Let's break this down into intermediate computations:

$$\begin{array}{lcl} \text{(prediction)} \; \hat{y} & = & \displaystyle \sum_{j=1}^d w_j x_j + b \\ \\ \text{(residual)} \; r & = & \displaystyle y - \hat{y} \end{array}$$

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023

38 / 57

• For a training point (x, y), the loss is

$$\ell(w,b) = \left[ \left( w^T x + b \right) - y \right]^2.$$

### Backpropagation: Overview

- Learning: run gradient descent to find the parameters that minimize our objective J.
- Backpropagation: we compute the gradient w.r.t. each (trainable) parameter  $\frac{\partial J}{\partial \theta_i}$ .

Forward pass Compute intermediate function values, i.e. output of each node

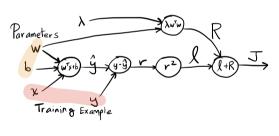

Backward pass Compute the partial derivative of J

w.r.t. all intermediate variables and the model parameters

How do we minimize computation?

### Backpropagation: Overview

- Learning: run gradient descent to find the parameters that minimize our objective J.
- Backpropagation: we compute the gradient w.r.t. each (trainable) parameter  $\frac{\partial J}{\partial \theta_i}$ .

Forward pass Compute intermediate function values, i.e. output of each node

Backward pass Compute the partial derivative of J w.r.t. all intermediate variables and the model parameters

How do we minimize computation?

- Path sharing: each node caches intermediate results: we don't need to compute them over and over again
- An example of dynamic programming

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 42/57

# Forward pass

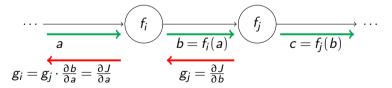

- Order nodes by topological sort (every node appears before its children)
- For each node, compute the output given the input (output of its parents).
- Forward at intermediate node  $f_i$  and  $f_j$ :

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 43 / 57

# Backward pass

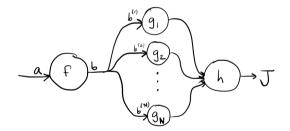

- Order nodes in reverse topological order (every node appears after its children)
- For each node, compute the partial derivative of its output w.r.t. its input, multiplied by the partial derivative of its children (chain rule)
- Backward pass at intermediate node  $f_i$ :

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 44/57

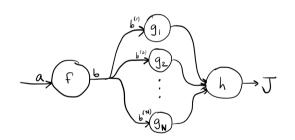

# Multiple children

• First sum partial derivatives from all children, then multiply.

# Multiple children

• First sum partial derivatives from all children, then multiply.

- Backprop for node f:
- Input:  $\frac{\partial J}{\partial b^{(1)}}, \dots, \frac{\partial J}{\partial b^{(N)}}$  (Partials w.r.t. inputs to all children)
- Output:

$$\frac{\partial J}{\partial b} = \sum_{k=1}^{N} \frac{\partial J}{\partial b^{(k)}}$$
$$\frac{\partial J}{\partial a} = \frac{\partial J}{\partial b} \frac{\partial b}{\partial a}$$

• We can write the chain rule in different orders of computation.

$$y = y(c(b(a))) \tag{9}$$

(12)

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023 46/57

• We can write the chain rule in different orders of computation.

$$y = y(c(b(a))) \tag{9}$$

$$\frac{\partial y}{\partial a} = \underbrace{\frac{\partial y}{\partial c}}_{D_4 \times D_3} \underbrace{\frac{\partial c}{\partial b}}_{D_3 \times D_2} \underbrace{\frac{\partial b}{\partial a}}_{D_2 \times D_1} \tag{10}$$

(12)

• We can write the chain rule in different orders of computation.

$$y = y(c(b(a))) \tag{9}$$

$$\frac{\partial y}{\partial a} = \underbrace{\frac{\partial y}{\partial c}}_{D_a \times D_3} \underbrace{\frac{\partial c}{\partial b}}_{D_3 \times D_2} \underbrace{\frac{\partial b}{\partial a}}_{D_2 \times D_1} \tag{10}$$

Backward: 
$$\frac{\partial y}{\partial a} = \underbrace{\frac{\partial y}{\partial c} \frac{\partial c}{\partial b}}_{D_4 \times D_3 \cdot D_3 \times D_2 \to D_4 \times D_2} \underbrace{\frac{\partial b}{\partial a}}_{D_2 \times D_1}$$
 (11)

(12)

### Fully connected vs. locally connected

- So far we apply a layer where all output neurons are connected to all input neurons.
- In matrix form, z = Wx.
- This is also called a fully connected layer or a dense layer or a linear layer.

### Fully connected vs. locally connected

- So far we apply a layer where all output neurons are connected to all input neurons.
- In matrix form, z = Wx.
- This is also called a fully connected layer or a dense layer or a linear layer.
- $\bullet$  For 200 imes 200 image and 1000 hidden units, the matrix of a single layer will have 40M parameters!

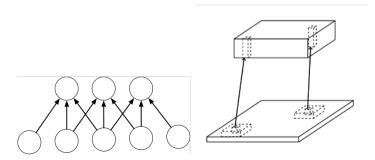

Mengye Ren (NYU) CSCI-GA 2565 Nov 21, 2023

55 / 57

### Fully connected vs. locally connected

- An alternative strategy is to use local connection.
- For neuron i, only connects to its neighborhood (e.g. [i+k, i-k])
- For images, we index neurons with three dimensions i, j, and c.
- i = vertical index, j = horizontal index, c = channel index.
